

Sprint 5 Review Meeting

What was accomplished in this Sprint and how did it add value?

We were able to integrate the new UI and the new backend, including the server. It added value by finally allowing us to have more than 2 devices communicating with distance scaling, which completes the requirements for our product. Additionally, we were able to find the correct server provider, which let us do what we needed without any extra restrictions. In this Sprint, we had to change the server because we were running into issues with our old one. We also got a bunch of testing done to integrate.

What (if anything) has changed in your environment?

One thing that has changed in our environment is Hitesh going to India. Obviously, this means that he isn't able to be in class and collaborate with us, but due to his jet lag he is still able to work with us virtually in Pacific Standard time. We also changed our server provider, which led to a couple of code tweaks.

What (if any) adjustments did you make to your product backlog based on the results of this Sprint?

We had to re-evaluate one of our original product goals. After making it to this point, we realized that we don't think it would make sense to add a blocking feature as that would conflict with our other goals of having a clean UI, as well as a smooth and hands-free driving experience (a blocking feature would require a list of all connected users to pop up which would be really long and clutter the experience). After consulting with our mentor, we realized that these goals are more important, and decided to get rid of the blocking feature.
