

Sprint 4 Retrospective Meeting

What went well during this Sprint?

Something that went well was completing most tasks we have during a sprint. We finished essentially all tasks and got major functionalities working independently of each other. This sets us up for the next sprint as we need to integrate everything together to end on a functional application.

What problems were encountered?

We ran into issues with testing our server code as the testing server is only exposed to the host it's being run on. As our app requires multiple users to test, only one user being able to access the server makes it not possible to test our location calculation and connect volume scaling to that without a public server.

Were these problems solved? If so, how, if not, why?

These problems are not fully solved; however, we have a plan in mind for a solution and will assign tasks to tackle this issue as part of our next Sprint. We are almost done with our project, and these are just small fixes.

What are the most helpful changes you can make to improve your effectiveness as a Team in the next Sprint?

The most effective changes we can make for our next Sprint as a Team would be having less absences and being here together. We were hindered a lot due to AP Exams, sickness, and various absences, which held us back from our full potential. If we are less absent the next Sprint, we can definitely do better.
